

The graph plots Voltage on the y-axis (ranging from -2.5 to 0.0) against Simulation time on the x-axis (ranging from 0 to 500). The voltage starts at 0.0, remains relatively stable until approximately 270 units of simulation time, then drops sharply to about -2.5, and continues to decrease in a stepped fashion to approximately -3.5 by 360 units of simulation time.
